COVER PHOTO: Not some monster from the deep but a drill section from a Drill Mine Mk 57 after 49 days underwater. At that it could be considered a monster by the mine crew called upon to overhaul it. The extended underwater drill life of Mines Mk 56-57 raises some questions of whether anti-fouling paint will be required as SOP for these drill mines.

1 JANUARY 1967

The Troubleshooter, an official NAVORD publication, contains technical information pertinent to the assembly, testing, and delivery of US naval depth charges and mines. It is both authoritative and directive in nature, and reference may be made to a particular issue as the authority for adoption of ideas promulgated therein.

Troubleshooter is also the official journal of the Rudminde Program a world-wide defect-reporting campaign designed to promote a high level of undersea warfare readiness in US naval depth charges and mines. The Program's basic instrument is NAVORD Form 8500/5 (I-63). Everyone who encounters problems with these weapons should report them via this form direct to the Naval Mine Engineering Facility as prescribed by NAVORDINST 8500.8.

ARTHUR R. GRALLA
Rear Admiral U.S. Navy
Commander, Ordnance Systems Command

Troubleshooter is published quarterly by the Naval Mine Engineering Facility's Publications Division and printed by NPPSO-5ND, in accordance with NAVEXOS P-35. Contributions, questions, address changes, and requests for regular distribution should be addressed to: Editor, The Troubleshooter, Naval Mine Engineering Facility (Code TSP), Yorktown, Virginia, U.S.A. Request copies of back issues from the Naval Supply Depot, 5801 Tabor Ave., Philadelphia. Each transmittal of this document outside the Department of Defense must have prior approval of the Naval Mine Engineering Facility.

THE OFFICIAL JOURNAL OF THE RUDMINDE PROGRAM

HOW TO USE A TORQUE WRENCH

TORQUE IS APPLIED every day by everybody. Every time a water tap is turned or the cap is screwed on a catsup bottle, for example, it is being measured unconsciously, by feel, and governed unconsciously through the lengths of handles and the person's strength.

In many instances the mineman applies torque to fastenings where his measurement is by feel, usually defined as "hand-tight" or "secure." Consciously or unconsciously, in such instances he is governed by the design of fastening such as a knurled nut or a wing nut, or by the length of the wrench (the smaller the bolt or screw the shorter the wrench) and of course by his strength. A heavy-handed sailor can wring off most any but the largest bolts if he sets his muscle to it. So always he must be governed by common sense.

It is when we are called upon to meet a requirement where the end-point of torque is critical enough to measure by a torque wrench that the "twist and leave" philosophy must be abandoned. Such requirements fall into two broad areas: 1) when two surfaces are brought together for a sealant property against leakage, as in tail-cover fastenings; and 2) when a fastening is required to be tightened to its ultimate pre-load design strength, as in the case of suspension lugs. In such cases there is simply no substitute for the torque wrench.

The operation of torque wrenches is not complicated. To use one properly, though, the mechanic must possess a basic knowledge of torquing mechanics and, as with any precision measuring tool, must exercise a reasonable amount of care and skill. In Troubleshooter 2-66 some rules for the care of torque wrenches were given. Here, in response to numerous requests, are some tips for their use.

- Force Application - When using a torque wrench, the force must be applied with a smooth steady pull up to the specified torque. Rapid or jerky pull up can result in considerable error in the torque values actually applied.
- Reading Torque - With the indicating-dial type of wrench torque is read on the dial at the same time the force is being applied.
- Head-End Tightening - When a fastening is tightened from the head end some of the applied torque is absorbed in turning the bolt in the hole. The amount of torque absorbed will vary depending on the clearance in the hole, "slipperiness" of parts, and alignment of the parts. For this reason torque values are generally specified for tightening fastenings on the nut end. In some instances, of course, there is no choice but to tighten from the head end. On these occasions fastenings should be tightened to the high limit of the torque value specified.
- New Nuts - It is good practice in torquing, especially in torquing new bolts and nuts, to first tighten the fastening to the specified torque, then loosen by backing approximately half a turn, then again come up to the specified torque. This aids in cleaning and smoothing the threads and, provides a more accurate torque application.

► Aligning for Cotter Pins - When a nut is to be locked against loosening by a cotter pin or wire the nut should be tightened to the low limit of the specified torque, and the hole then aligned by a tightening operation. Never loosen a castellated nut to obtain alignment.

► Thread Lubrication - Threads should always be clean and free from nicks, burrs, paint, grease, or oil to obtain the correct tension or pre-load on the bolt when it is tightened to a specified torque. True, there are some applications where lubrication or anti-seize compound is used on the threads. In such cases the maintenance manuals should always be consulted for compatible torque values.

► Damaged Threads - Studs with damaged threads should be replaced whenever possible. When not, the threads should be chased. Often, however, this is not possible in field maintenance. To overcome the problem of properly torquing a nut on a stud where thread damage is present, and therefore increases the rundown resistance of the nut, add the run-down resistance to the specified torque. The run-down resistance should be measured on the last rotation before the nut seats. For example,

(continued on page 4)

TORQUE-WRENCH CALIBRATION

Last time we talked about torque wrenches (Issue 2-66) the rule was to calibrate them every three months. Now the Metrology Engineering Center at Pomona, with the idea of lightening the load, have reviewed their data and made these changes to the Metrology Requirement List (NAVWEPS 17-35 MTL-1) which Navy Calibration Labs use as their guide to calibration cycles:

- Torque tools manufactured by Richmont and Sturdevant to be calibrated every six months.
- Torque tools manufactured by Snap-On Tools, Inc., to be calibrated every three months
- Torque tools manufactured by APCO-Mossberg and Torque Controls to be calibrated on a 30-day cycle.

For most mine facilities a 30-day calibration cycle would be prohibitive since tools would either be in the calibration lab or in transit most of the time. Rather, the goal should be to purge these short-cycle torque wrenches from the system, and to this end the General Services Administration (GSA) is initiating action to restrict these 30-day cycle tools from issue.

Meanwhile when you need to replace torque wrenches you should specify the vendor and thereby escape this 30-day turn-around. Otherwise FSNs 5120-242-3264 (50-0-50 ft-lbs) and 5120-230-6380 (150-0-150-in-lbs) could produce torque wrenches manufactured by any of the above manufacturers. GSA has also requested that torque wrenches which have failed qualification or calibration be returned to the nearest GSA regional office with a report giving reason for return. In exchange GSA will send you a free replacement.

MOISTURE BARRIERS

A LOT OF WATER, several NAVORD instructions, and some pertinent Troubleshooters have gone over the dam since we last discussed moisture barriers for mine case openings. That was back in Issue 2-59 when no one had yet dreamed of Assembly Conditions A, B, etc. Now these conditions are with us and it has been decided that moisture barriers will be required on all mines in Conditions A through D inclusive. So here we go again.

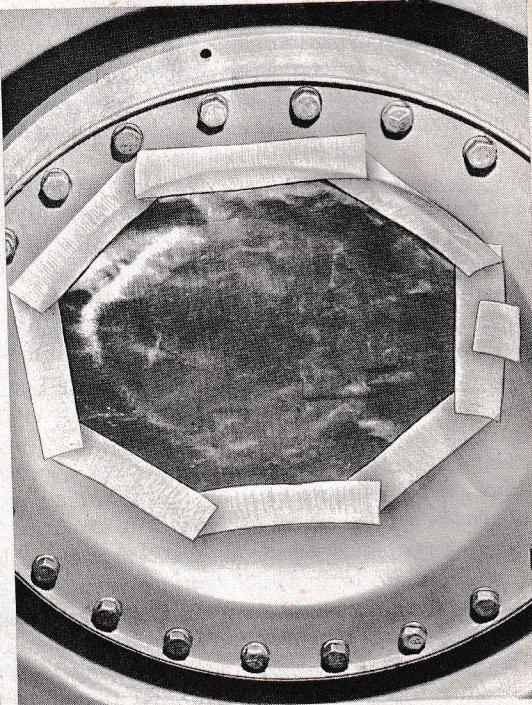

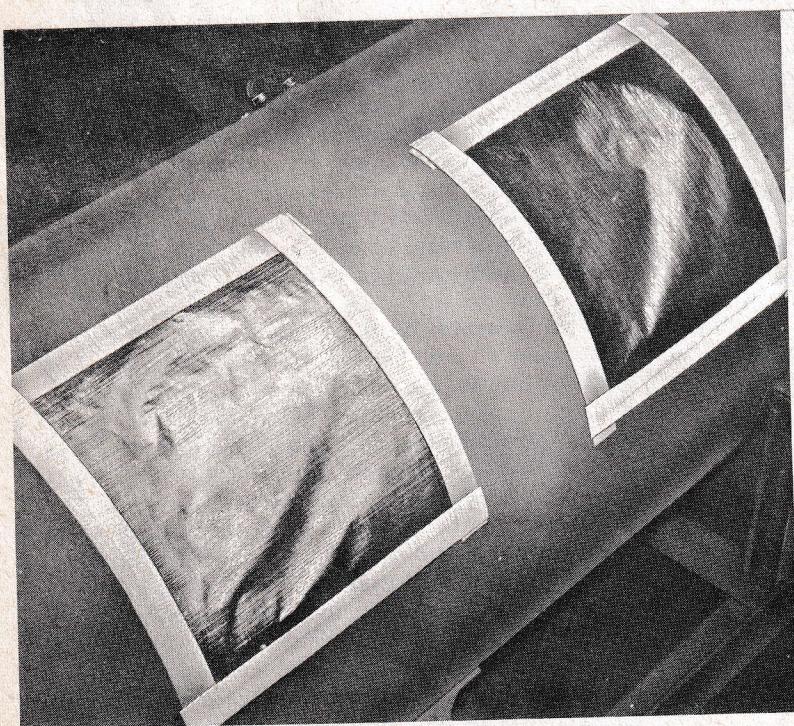

Before applying the barriers, fastenings for all watertight case openings should be torqued to 5 lb-ft for mines assembled to Conditions B, C, and D or to 16-20 lb-ft for Condition A . . . always with that inevitable exception: filling-hole covers, whose fastenings should never be tightened or loosened.

The purpose is to protect the rubber diaphragms of components such as hydrophones, extenders, clock starters, arming devices, hydrostatic switches etc. from the effects of long-term exposure to the atmosphere. Squares of the barrier material cut to appropriate size and taped on all edges make a simple job of openings in the sides of cylindrical mines, such as clock and extender wells. Tail covers call for more trimming and shaping. For the Mk 52 and 55 mines' tail covers the protruding cross members make it necessary to deal with hydrophones, pressure detectors, and depth compensators individually, depending on the mod involved. Shown here is a tail cover dressed in barriers for a Mk 52 or 55 Mod 4 or 6.

From this it will be seen that moisture barriers will also be required when the several sections that make up Mark 56 and 57 mines are assembled to Conditions C or D, as well as when these sections are married in the transition to Conditions A or B. Note that in these, as in 52/55s, hydrophones and depth compensators will be installed in tail covers for Conditions A through D but pressure detectors will be installed in A, B, and C only. Barriers must fit snug around the safety bars installed over the arming devices and hydrostatic switches in Condition A 57s.

Approved materials are named in the explanations accompanying the illustrations. Some general rules to remember, pending incorporation of specific details on assembly conditions in the technical manuals for the various mines, are:

- Refer to Bulletin 095 for instructions on gasket and O-ring replacement, greasing and cleaning flanges of watertight openings, torque requirements, etc.
- Clean adhesive surfaces and use new material when replacing barriers that have been removed to permit maintenance, or conversion from one assembly condition to another.
- Be sure to remove barriers from tail covers before installing flight gear on air-laid mines . . . and from all openings before delivery to aircraft or submarines.

An example of the use of a square patch of barrier material as applied to clock and extender wells. On right is tailplate application on Mine Mk 36 Mod 2. Tape to use in all cases is pressure-sensitive, adhesive, cloth-backed 'Ordnance tape,' just reinstated by GSA; MIL-T-22085, 8135-003-0009 for 2-inch-wide 60-yd roll.

BIBLIOGRAPHY NO. 6

for depth charges & mines

SUPPLEMENT TO TROUBLESHOOTER 4-66

FOREWORD: BIBLIOGRAPHY NO. 6

As in Bibliograph No. 5, it seems desirable to reiterate a philosophy that has been overlooked in some quarters. To wit: Sections 1 and 2, to the best of our knowledge, for every weapon included therein, list every available technical publication that assembly activities need in their possession in order to be 100% combat ready. Thus it has been our purpose, in Bibliography No. 5, and again in this one, to eliminate further research by our readers to unearth necessary Bulletins, Instructions, Notices, Ordnals, etc.

In short, we're saying that any technical pub that's not listed is either not available, or not necessary to weapon assembly, or both. If we've missed something we think we should be gigged for failing to inform our readers, rather than our readers being gigged for not being informed. We think any posing of requirements in excess of these listings, for technical publications specific to the weapons, are simply not valid.

We have made no changes in the format of Bibliography No. 6, and the two-digit interim change system for OPs and ODs is still in effect. It's explained in the introduc-

tion to Section 6, and on backs of the title pages of all the mine-assembly OPs, so we'll say no more here. Again Sections 1 and 2 list the OPs, ODs, etc., but not the latest revisions and changes. Instead you turn to Section 1 or 2 to learn what publication you need for what purpose with which weapon. That will give you a basic publication number, like OP 1808 Volume 1. If you want to know more you can then turn to Section 6. There you will learn how to get OP 1808 Vol 1., and will find listed the prescribed revision, all interim and permanent changes, the Cog-I stock number for requisitioning each, and (via footnotes) any special info we felt you should have about that book.

The same applies to all the pubs listed throughout this bibliography. As before, part of this plan derives from the fact that all of the information subject to frequent change is now concentrated in a single section: Section 6. In this way the bibliography also provides a complete listing of pubs in pub number sequence.

New in Bibliography No. 6 is a listing of overhaul specifications (OVSSs).

CONTENTS

SECTION 1: Mine Assembly & Test Instructions	1
SECTION 2: Depth-Charge Assembly, Test, & Use	7
SECTION 3: Test-Set Calibration Instructions	8
SECTION 4: General Reference Publications	10
Pubs for Mine Tests	
SECTION 5: Allowance Lists	11
SECTION 6: Pubs Status & Ordering Info	11
NAVORD OPs	11
Forms	15
Troubleshooters	15
Ordnals & ODs	15
T-Shooter Bulletins	16
Overhaul Specifications (OVSSs)	17

IS THIS BIBLIOGRAPHY OUR LAST?

Probably so, and if you read the editorial (Rudminde Report) in Troubleshooter 3-66 you'll know why: the new OP 3504 will ultimately include a volume that we hope will do the job better, and will be a permanent part of the authorized configuration control data resultant from NMEF's integrated logistics management system.

Truthfully, though, we hate to see the Bibliography's demise. It's turned out to be the handiest piece of gear on ye editor's desk and we know from many kind Rudmindes and notes that plenty of others feel the same way.

That being the case, we definitely want users to continue to report errors in this one, and we'll definitely try to keep all hands advised of any important changes between now and the time we release Op 3504 Volume 6. When we do, we hope you'll like it. We hope you'll find that it will do all this Bibliography does and more.

SECTION 1: MINE ASSEMBLY & TEST

Note that this section lists basic publication only. To learn the authorized revision number, etc. for a listed pub, see Section 6.

SECTION 2: DEPTH-CHARGE ASSEMBLY, TEST, & USE

Note that this section lists basic publication only. To learn the authorized revision number, etc. for a listed pub, see Section 6.

Depth Charge Mk 6 Mods 0, 1, & 2

Assembly: OP 747
Gen'l Requisites: OD 17160
Class B & C Tests: In assy manual
Maintenance Requirements: OPs 1860, 3379, & 3388
Op'n'l Characteristics: In assy manual
Shipboard Instructions: In assy manual
Ordalts: 1505 - Booster Extender 6-1, Retainer
1893 - Booster Extender 6-1, Safety Fork
2292 - Arbors 6-0 & 7-0, 1 to 7-4
T-Shooter Bulletins: None
T-Shooter Articles: Issue 4-63 p3

Depth Charge Mk 8 Mods 3, 4, & 5

Assembly: OP 2960
Gen'l Requisites: OD 17160
Class B & C Tests: In assy manual
Maintenance Requirements: OPs 1860, 3379, & 3388
Op'n'l Characteristics: In assy manual
Shipboard Instructions: In assy manual
Ordalts: 2292 Arbors 6-0 & 7-0, 1 to 7-4
T-Shooter Bulletins: None
T-Shooter Articles: Issue 4-63 p3

Depth Charge Mk 9 Mods 2, 3, & 4

Assembly: OP 866
Gen'l Requisites: OD 17160
Class B & C Tests: In assy manual
Maintenance Requirements: OPs 1860, 3379, & 3388
Op'n'l Characteristics: In assy manual
Shipboard Instructions: In assy manual
Ordalts: 2292 - Arbors 6-0 & 7-0, 1 to 7-4
T-Shooter Bulletins: 013 - Impulse charges
T-Shooter Articles: Issue 4-63 p3

Depth Charge Mk 14 Mod 0

Assembly: OP 669
Gen'l Requisites: OD 17160
Class B & C Tests: In assy manual
Maintenance Requirements: OPs 1860, 3379, & 3388
Op'n'l Characteristics: In assy manual
Shipboard Instructions: In assy manual
Ordalts: 10016 - Test Set 127-3 to 127-4
T-Shooter Bulletins: 013 - Impulse charges

Depth Charge Mk 16 Mods 0 & 1

Assembly: OP 2107
Gen'l Requisites: OD 17160
Firing Mech "B" Tests: OP 669
Other B, C Tests: In assy manual
Maintenance Requirements: OPs 1860 & 3379
Op'n'l Characteristics: In assy manual
Shipboard Instructions: In assy manual
Ordalts: 10016 - Test Set 127-3 to 127-4
T-Shooter Bulletins: None

12.75 Rocket Mk I Mod 0 (ASP)

Assembly: OP 2027
Gen'l Requisites: None
Class B & C Tests: OP 1792
Maintenance Requirements: OPs 1860
Op'n'l Characteristics: OP 1792
Shipboard Instructions: In assy manual
Ordalts: None
Ballistic Tables: OP 1829
T-Shooter Bulletins: None

'Roberts just washed his feet and can't do a thing with 'em!'

SECTION 5: ALLOWANCE LISTS

Allowance lists, designated variously by NAVORD LISTS, NAVWEPS LISTS, and ORDLIST numbers are available by letter request from U.S. Navy Ships Parts Control Center, Mechanicsburg, Pa. 17055.

MINES

- NAVWEPS LIST 24220 (8 Dec '60): Assy & Replacement Parts; Drill Mine Mk 6-0
NAVWEPS LIST 24221 (29 Nov '60): Assy & Replacement Parts, Tools, & Accessories; Drill Mine Mk 10-3
NAVWEPS LIST 24222 (25 Nov '60): Assy & Replacement Parts and Tools; Drill Mine Mk 18-0
NAVWEPS LIST 24223 (17 Nov '60): Assy & Replacement Parts, Tools, & Accessories; Drill Mine Mk 49-0,1,2
NAVWEPS LIST 24224 (27 Nov '60): Assy & Replacement Parts, Tools, & Accessories; Drill Mines Mks 52/55
NAVWEPS LIST 23922-B (20 Dec '62): Mine Assy & Maintenance Parts
NAVORD LIST 24036 (11 Mar '57): Assy & Replacement Parts, Tools, & Accessories; Drill Mines Mks 25/36
NAVORD LIST 23642-A (12 Jan '56): Tools & Test Equip for Controlled Mine System Mk 1 and Acoustic System Mk 6

* Stocked at Naval Mine Engineering Facility (ESI), Yorktown, Va. 23491; supersedes NAVORD LIST 22501-E (29 Apr '58) and BUWEPINST 08011.15 (22 Jan '64).

NAVMINENGRFACINST 8011.1 (15 Jan '66): Allowance List for Mine Test Sets, Tools, and Miscellaneous Equipment*

APL 0-006100043 thru 0-006100055: Special Tools; Mines Mks 6/10/18/27/36/39/52, also K3, K4 Mechs, Needle Fire Mech, Hydrostat Mk 2, Antenna Mk 1-1, also Basic Mine Tool Set

APL 0061 Series: Mine Test-Set Repair-Parts List
ORDLIST 23107-C: Mine Material for Training Purposes
ORDLIST 22982-A: Mine Training Material for NROTC
ORDLIST 22981-B: Mine Training Material for NROTC

DEPTH CHARGES

- NAVORD LIST 22466-G (26 Feb '54): Depth-Charge Material
NAVORD LIST 22500-D (26 Oct '55): Depth-Charge Material
ORDLIST 23847: Depth-Charge Material
NAVORD LIST 24035 (18 Jun '58): Depth-Charge Components & Repair Parts

DEPERMING—DEGAUSSING

- NAVWEPS LIST 24204 (7 Nov '60): Deperming Equip Repair Parts
NAVORD LIST 23734-C (12 Oct '59): Degaussing Ranging Equip Repair Parts

SECTION 6: PUBS STATUS & ORDERING INFO

Except for a few special cases, all of the publications referenced elsewhere in this bibliography are grouped in this section according to publication type. (OPs, ODs, Bulletins, etc.) and listed within those groups by publication number, in numerical sequence. In each case the revision which is listed is the only revision specifically authorized for fleet use, unless otherwise noted. In addition to specifying the approved revision, all changes current at time of publication are also listed.

Cog-I publications. The first group of publications consists of NAVORD OPs. OPs and OP changes are stocked in The Navy Supply System under inventory management of the Planning/Control Dept., Naval Supply Depot, Philadelphia, as Cognizance-I items of supply. Stock numbers are listed for each, and these publications should be ordered by stock number, via NAVSTRIPS forwarded direct to NSD/Philadelphia. There is no charge for Cog-I pubs.

About ordering changes. OP changes are stocked as separate items of supply but they receive special automatic processing which should be taken into consideration when ordering. Suppose, for example, you find that you need two copies of Change 2 to OP 1807 Vol 2, to make your copies of that volume complete: Simply order the two copies of the change, by its listed stock number. Suppose, though, you need an extra copy of the OP itself, and you find there are four changes in existence, and you want to be sure you get all the changes too. Do you need to send a separate NAVSTRIP for each change?

You do not. Any time you order an OP by its Cog-I stock number from the NSD, all current changes will be forwarded to you in it whether you ask for them or not. If you also ordered changes separately, you'd end up with an OP with all changes, plus an extra

set of changes for which you have no OP. That's waste.

It will be noted that some change numbers are not consecutive (e.g., the listing under one OP includes Changes 1, 2, 31, and 32, in that order). The reason: for mine and depth-charge publications single-digit changes (e.g., Change 2) are permanent changes, and two-digit changes (e.g., Change 32) are interim changes. For the interim the first digit (in this case the 3) indicates the number of the next permanent change, which will cancel the interim, while the second digit (the 2) indicates that this is the second interim released pending release of that permanent change.

FOOTNOTES FOR SECTION 6

- 1 - Changes 1, 2 to OP 5 Vol 3 apparently supplied only with complete copies of Vol 3.
- 2 - Users of OP 605 also require T-Shooter Bulletin 017 from NMEF.
- 3 -- Advance copy of assembly manual for Drill Mine Mk 18 (Change 1, published as separate volume) available only from NMEF. Drill Mine is not active; manual is not required in field.
- 4 - OP 1391 still in current stocks but has not been maintained up-to-date. Pending revision, similar info is available from NMEF via confidential BUWEPS Mine Familiarizer.
- 5 - Basically, Rev 2 is still the preferred edition of OP 1452. Preliminary edition of 3rd revision out of stock but approved for use by holders for the tests of few components not included in Rev 2 or 4. Revision 4, of which Vol 1 (Batteries, Sterilizers, and Explosive Devices), Vol 2 (Hydrostatic Devices), and Vol 5 (coils, relays, and counters) have already been released, will be completed in 1967 and does supersede related subject matter in Revisions 2 and 3. For new components not yet approved for service use, use OP 3409.
- 6 - Change 1 to OP 1538 apparently supplied only with complete copies.
- Rev 4 to OP 1684 scheduled for release in 1967. Advance copies of Rev 3, dis-

- tributed for selected activities review, not in stock and not approved.
- 8 - Users of OP 1816, volumes 1 thru 6, also require T-Shooter Bulletin 004 from NMEF.
- 9 - Volume 5 of new edition of OP 1860 scheduled for distribution to all mine activities, all calibration labs, first half of 1967.
- 10 - OP 2239 Rev 2 reprinted and includes Ch 1 to old edition. Holders of old edition who wish only Ch 1 use 0609-223-9007.
- 11 - OPs 2572, 2718, 2815, 2816 available only in preliminary edition from NOL, White Oak, Maryland.
- 12 - Rev 1 to OP 2608 scheduled for release in 1967 will include Mine Mk 55, thus replacing Rev 0 to 2608 and Rev 0 to 2974.
- 13 - OPs on individual mine test sets have been incorporated in new edition of OP 1860, scheduled for distribution to all mine activities, all calibration activities, in 1967. Review drafts of test set OPs 2775, 2779, 2792, and 2897 available only from NOL, White Oak.
- 14 - Review draft of OPs 3208, 3209, 3210, 3211 available only from NOL, White Oak.
- 15 - OP 3232, a new basic volume covering mine prep for delivery to all mine-laying aircraft, is scheduled for re-
- lease first half 1967. This volume, plus new Air Systems Command Mine-Loading check lists, will cancel all current and planned supplements to OP 3232 (for detail see page 1, Troubleshooter 1-66). NASC mine-loading check lists are currently available from NSD/Philadelphia (stock numbers not yet available) as follows: 01-40AL-75-6 (A-1H/J airplane); 01-40AT-75-6 (A-3B); 01-85AD-75-6 (A-6A); 01-45AA-75-6 (A-7A); 01-40AV-75-14 (A-4B/C/E); 01-75PA-75-6 (P-3A/B); 01-75EE-75-6 (SP-2H). Future NASC mine check lists will get automatic distribution to mining missions via NMEF's distro system.
- 16 - OP 3344 in preparation; in interim use NWL Table 03-63-002, available from U.S. Naval Weapons Laboratory, Dahlgren, Va. 22448.
- 17 - OP 3388 not scheduled for release pending further notice.
- 18 - OPs 3409, 3410 provide advance info on material not yet approved for procurement in quantity for service use; available only from Mine Warfare Division, HQ NOSC.
- 19 - OP 3504 scheduled to supersede OD 10,604, all mine general-requisites ODs. Binders and content for volumes 1, 2, and 4 scheduled for release early 1967, others later 1967. For more see Rudminde Report, Troubleshooter 3-66.

Ordalts and Navord ODs

NAVORD ODs and Ordalts are stocked at the Central Technical Documents Office, Louisville, Kentucky 40214. They do not have stock numbers, and must be ordered by a written request (letter or card). ODs fall into two categories: those designated by asterisks (*) are manufacturing design documents which should not be requisitioned by field activities other than depots. Those without asterisks are used primarily by field activities.

The many general-requisite-type ODs for underwater mines formerly included in this list have been dropped since they are being superseded early in 1967 by OP 3504 as explained on page 1, Troubleshooter 3-66.

Ordalts, too, fall into two categories. Those designated by asterisks (*) require performance by major depots and should not be requisitioned by field activities; those without asterisks are for performance by depot and field. Stocks of asterisked ODs and Ordalts are purposely small; they would be quickly and needlessly exhausted if field activities fail to comply with the instructions above.

ORDALTS

NO.	SUBJECT	AFFECTED WEPS (MK-MOD)
1505	Booster Extender 6-1; Retainer	D Chg 6
1893	Booster Extender 6-1; Safety Fork	D Chg 6
2292*	Arbors 6-0 & 7-0, 1 to 7-4	D Chg 6/8/9
2839	Clock Starter 1-1,2 to 1-10,11	39
2886*	Case 6-3 to 6-5	6-0 thru 11
2903*	Control Box 13-0 to 13-1	25-2/49-2
2972	Alter Case 10-3,6,7	10-9
2981	Alter Test Chamber 1-0 & 1	Obsolete
3065	Anchor 10-3 Starting Lever Plate	10-3
3107	Anchors 6-0,3,6,7 to 6-5,8,10,14	6s
3109*	Anchor 16-0 to 16-1	6s
3147	Alter Circuit Breaker 1-0	25-0/49-0
3152	Anchor 10-1,3,5; Securing Jaws	10-3,9
3244	Alter Exercise Head	27s

* Before requisitioning copies, see explanation above. Small s after mark number means all active mods.

1 - Also used by Depots for Depth Charges Mks 14 & 16.

2 - Scheduled for release in April 1967.

Troubleshooter Bulletins

All T-Shooter Bulletins are listed here including those that have been cancelled so you can discard bulletins no longer in effect and explain missing numbers in your files. T-Shooter Bulletins are stocked by The Naval Mine Engineering Facility (ESI), Yorktown, Virginia 23491. All bulletins are automatically cancelled three years from date of release.

Overhaul Specifications (OVSs)

Overhaul Specifications (OVSs) are published by NMEF. They are published only as needs arise but are thereafter maintained current. Prepared as guides for use in performance of depot-level rework and repair, OVSs are not distributed to intermediate or organizational-level maintenance activities (definitions per OP 3379), nor is there any requirement for mining missions at those levels to hold copies. Such activities should not, therefore, request copies, since stocks are purposely too small to support such requests. Depot-level activities can obtain copies direct from NMEF (ESI).

All OVSs so-far published are listed below . . . including those (identified by asterisk [*]) which have been cancelled or superseded . . . so depots can confirm whether their OVS catalogs are up-to-date and complete.

OVS NUMBER	COMPONENT	AFFECTED MINE (MK-MOD)

Here 'Affected Mine' column refers to another OVS instead of listing a weapon, the OVS has been superseded by the OVS to which the 'Affected Mine' column refers. Affected weapon(s) will be the same. Small s after mark number means all active mods material cancelled.

ARE YOU HAPPY ABOUT PUBS DISTRIBUTION?

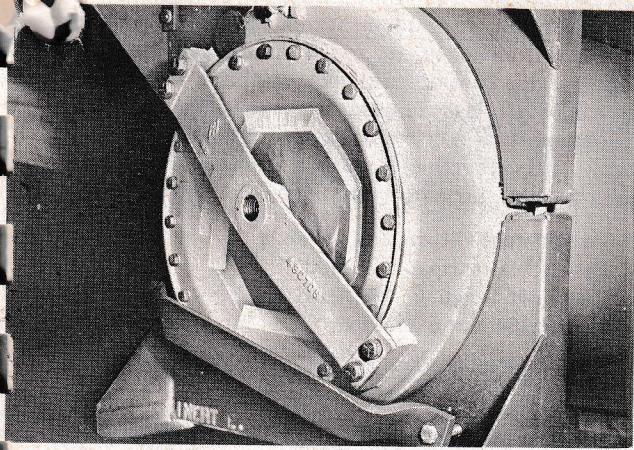

If not it may be your own fault. Regardless of stock point, the initial distributions of all mine publications except those controlled by the Mine Warfare Division, NOSC (e.g., OPs 2637, 3409, 3410, and manuals on mines and equipment not yet accepted by CNO for service use) are performed by automated machinery at NSD/Philadelphia, and a special post office whose sole activity is the distribution of Navy pubs.

The machinery is operated by master control tapes which contain, among others, eight distribution formulae tailored to mining interests. These formulae and the distributions effected by them are monitored and controlled by NMEF.

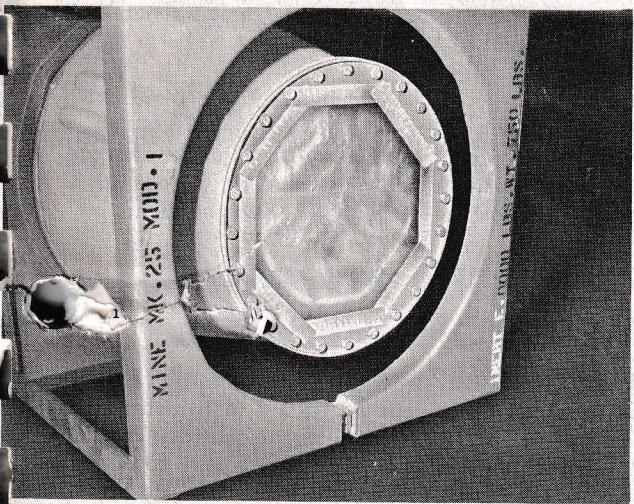

NMEF's policy, of course, is that any U.S. Navy activity, anywhere, at any time, can request to be included in or omitted from this system, or to regularly receive from it as many or as few copies as they think they need. In short, the system is specifically geared to give you just what you want, automatically, every time, without fail. What it will not do, though, is read your mind, nor respond to prayers, nor to cries of protest made at the wailing wall. To change those master control tapes requires a letter or card addressed to NMEF (ESP). No more. But no less!

If you want to be super specific when you write, give us the list numbers and the number of copies you wish to receive regularly on each. Here they are:

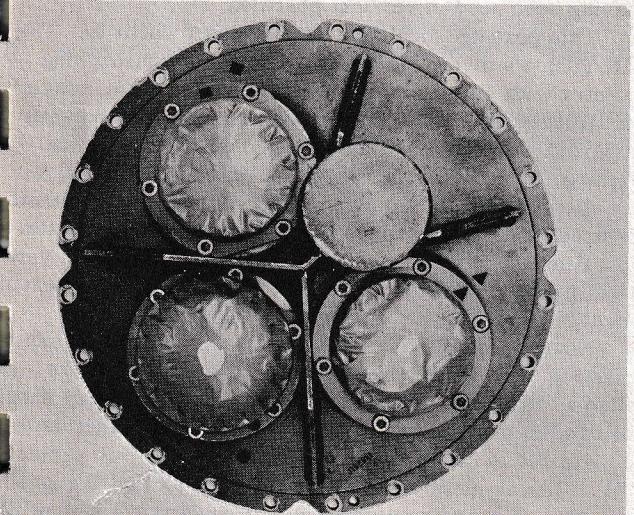

<u>DIST LIST NO.</u>	<u>DESCRIPTION</u>
WO58160000	Periodical: The Troubleshooter. Also occasional Bulletins of especially wide interest.
WO58160100	Weapon assembly manuals, changes, check lists, etc., pertinent to submarine-laid mines.
WO58160200	Weapon assembly manuals, changes, check lists, etc., pertinent to air-laid mines.
WO58160300	Weapon assembly manuals and changes pertinent to surface-laid mines.
WO58160400	Bulletins, field-performance ordalts, manuals pertinent to all mines (e.g., OPs 1452, 2567, 1860), etc.
WO58160500	Manuals, bulletins, changes, etc. pertinent to depth-charges.
WO58160600	Releases pertinent to aircraft squadrons and activities which have mining, but not mine assembly, missions.
WO58160700	Releases pertinent to submarine squadrons and activities which have mining, but not mine assembly, missions.
TS2D160800	Releases pertinent to laboratory calibration of test sets: restricted to rework activities and labs participating in the mine test-set calibration program.

Barrier material should be applied to tailplate of Mine Mk 49-1 to protect Hydrophone MI-4, by using a 9½-inch square patch with corners cut off 2¼ inches from points.

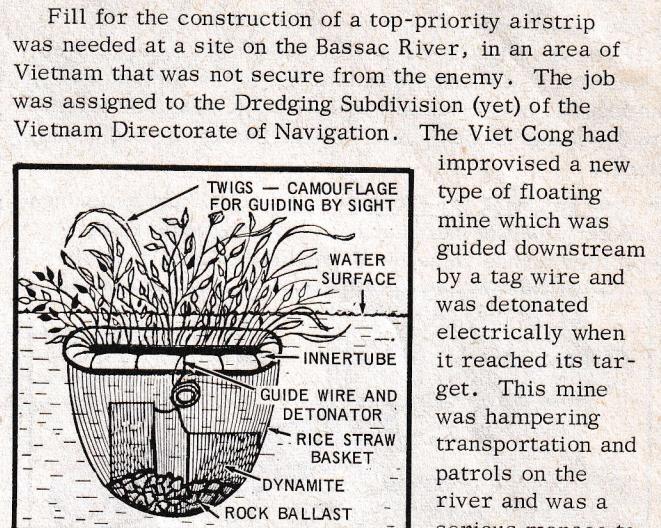

Install moisture barriers over hydrophone in Mine Mk 25-1 using 13-inch square patch with corners trimmed 3¾ inches from points.

Apply barrier material to 52/55 tail covers, cut material to size of components and seal all around with tape. Barrier material, MIL-B-131, 8135-282-0565, comes 3 ft wide in 200-yd roll.

ROUNDER SHOOTER 4-66

VIET CONG FLOATING MINE

Fill for the construction of a top-priority airstrip was needed at a site on the Bassac River, in an area of Vietnam that was not secure from the enemy. The job was assigned to the Dredging Subdivision (yet) of the Vietnam Directorate of Navigation. The Viet Cong had improvised a new type of floating mine which was guided downstream by a tag wire and was detonated electrically when it reached its target. This mine was hampering transportation and patrols on the river and was a serious menace to the dredge assigned to the project. To obviate the danger, Sol Brown (Maritime Adviser and Chief of Ports and Waterways Section of USAID Public Works Division) obtained from the Navy some old 8-in-mesh mine nets, which were hung completely around the dredge on 11-ft outriggers set in sleeves welded to the hull of the dredge. Thus the mine net, draped like a hula skirt, became part of the operating dredge, and provided constant protection for it. The dredge operated continuously in three shifts a day for 14 months to complete this project. Although many other craft were damaged and sunk by mines, the dredge KIEN GIANG operated in safety. This is believed to be a unique use of mine nets to protect a hydraulic suction dredge operating under combat conditions. (Reported in *The Military Engineer* by Sol H. Brown.)

"Not missing, but stationed at Indian Island Annex, NAD Bangor, Bremerton, Washington," writes LT. B.J. Smith, who sends this photo of his unit to let fellow minemen know where they are. Left to right are:

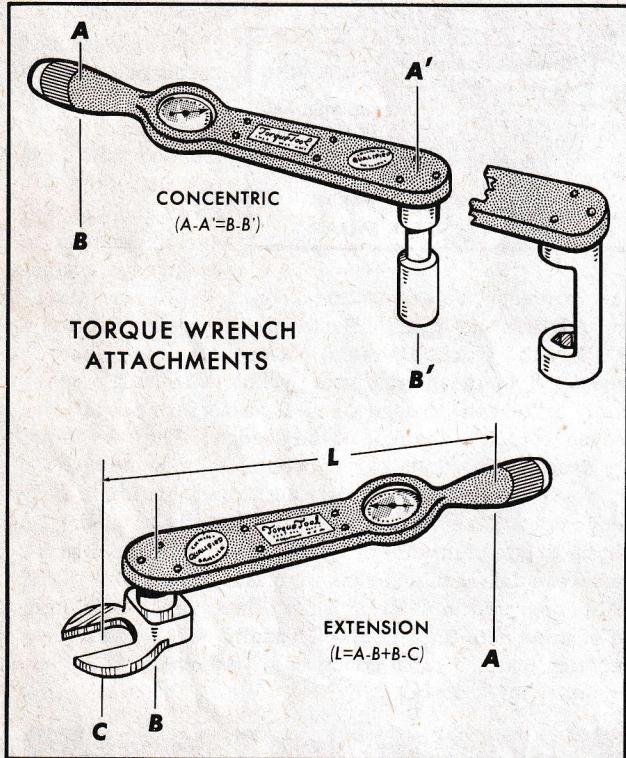

MNC J. Alonzo, LT. B.J. Smith, Mine Division Officer, MN3 E.A. Boeing, TMCS C.M. Edwards, Leading Chief, MN2 R.A. Shaw, MN2 N.R. Fantasia, MN2 G. Mason, and MN2 F.D. Bartram. Absent when the picture was taken is TMCS J.H. Keen.

TORQUE

(continued from page 1)

325 pound-inches of torque has been specified for an application, and run-down resistance due to thread damage is found to be 25 pound-inches, the nut should be torqued to 325 pound-inches plus 25 pound-inches, or 350 pound-inches.

► How To Check Pre-Torqued Nuts - Checking fastenings to determine whether they have been tightened to the specified torque value is not possible to do accurately

because a fastening that has been tightened to a specified torque will require approximately ten percent more torque (more than was originally applied) to overcome friction and start the fastening turning. When there is doubt as to whether a fastening has been tightened to the correct torque, then, the fastening should be backed off from a half to a full turn and then retightened to the correct torque value. A torque wrench should not be used for the back-off operation.

► Use of Attachments - Many torque-wrench applications will require the use of attachments such as adapters and extensions to reach fastenings in places of limited accessibility, or to allow positioning the torque wrench so that the dial can be easily read.

► Concentric Attachments - The use of an attachment which operates concentrically with the drive square of the torque wrench presents no particular problem since the effective length of the wrench is neither extended nor shortened. The torque applied to the fastening in such cases will therefore be the torque indicated on the torque-wrench dial.

► Non-concentric Attachments - On some torque applications it will be necessary to use a torque-wrench attachment that does not operate concentrically with the wrench drive square. In such cases, such as when using an elongated crows foot, the attachment adds to the lever length. To determine a correct torque reading in such cases use this formula:

$Tw = \frac{Ta \times L}{L + A}$

Tw - Indicated torque on wrench

Ta - Actual torque specified

L - Lever length

A - Attachment extension

$$Then Tw = \frac{Ta \times L}{L + A}$$

In using the formula the lever length "L" is a critical factor. On a flexible-beam-type wrench with a pivoted grip, this dimension is fixed and the pivot point of the grip determines the point of force application, and thus the length of the lever. On rigid-frame wrenches, however, the point of force application must be in the center of the grip.

There are other attachments not in general use by minemen, such as torque multipliers, offsets, and angle extensions, as well as pre-set and adjustable torque wrenches. If by chance you should run across any of these learn how they work before you use them.

KEEP YOUR AN/PSM-4 METER ON THE LEVEL

YOU CAN LENGTHEN the life and minimize out-of-service time of your AN/PSM-4 multimeter by using it properly. Calibration laboratories are receiving a number of these multimeters that require repair to meter movements before they can be properly calibrated. In most cases the meter has failed to zero properly because of worn pivots and bearings attributable to the meters having been used in vertical position.

This perhaps should not be a problem but it is. The AN/PSM-4's meter incorporates an exceptionally long pointer with inadequate counterbalance (a common fault of all large-scale low-cost meter movements) and after a period of use this results in rapid wear and eventual failure, meantime requiring frequent bearing readjustment. The problem is considerably lessened if the meter is used in a horizontal position. Also, since the meter is calibrated in the horizontal position, using it in a vertical position can induce considerable measurement error on some of the meter's scales.

Now all Navy calibration laboratories have been advised to apply a "Limited Use" decal to these meters. Also a tag will be attached indicating that the meter should be used in the horizontal position if rated accuracy is to be attained. This applies to AN/PSM-4s through series "D". Newer meters are expected to have a more rugged mechanism, pending a complete re-design, but meanwhile custodians of those which do not have the lab decal, them should attach a typed tag or label reading "Use meter in a horizontal position whenever possible."

Do You do this Job Right?

BATTERY HOOK-UP SOP

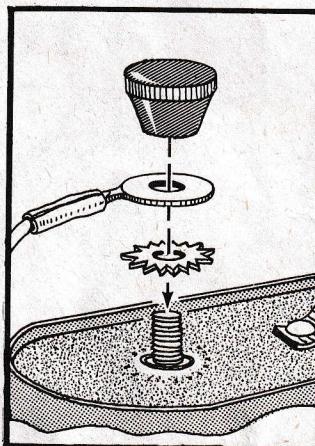

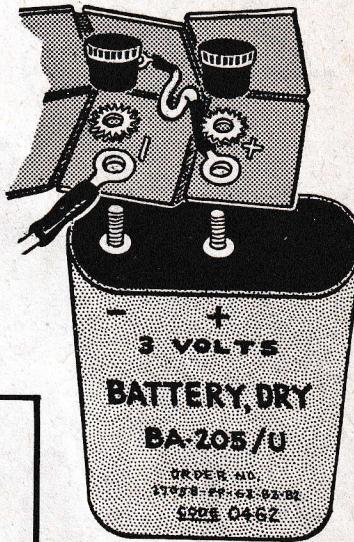

SOME QUESTIONS, unlike old soldiers, not only don't die . . . they don't even fade away. Witness Rudmindes from Chief J. D. Hallstrom (NAVMAG Sanfran 96650) and MN2 Don Allgor at MCAS Sanfran 96664, both pointing out that an answer we gave back in T-Shooter 4-64 was fine as far as it went, but that it didn't go far enough (ignored card-type connectors), showed internal-tooth lockwashers (external-tooth so-called "starwashers" are now standard), and was not consistent with the mine-assembly OPs (namely 1684 Vol 1 Rev 2, 1892 Vol 1 Rev 2, 1798 Vol 1 Rev 3, and 956 Vol 1 Rev 4).

So what's the rub? "Our production-quality inspector," writes Hallstrom, "says we do it by the book," concluding rightly that it's up to NMEF to "the books" right.

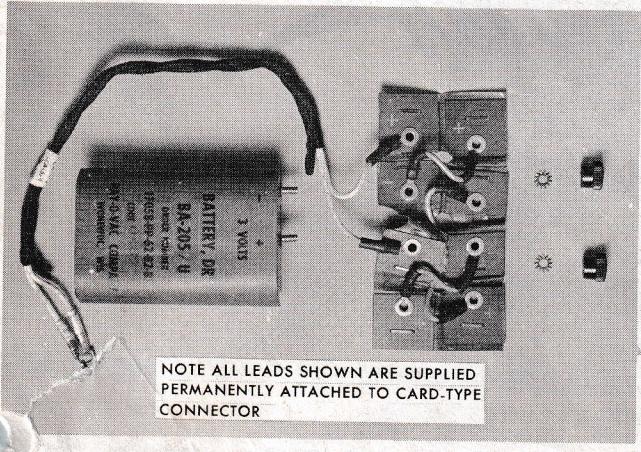

Here, then, is an SOP which to the best of our knowledge will fit all cases: the card-type connectors such as are found on Cables CA-535, 546, and 579, as well as the garden-variety lug-type found on the others. The washers we show are starwashers (external-tooth lockwashers) such as are now supplied on virtually all screw type battery terminals, but the order of installation should not change if somewhere internal-tooth washers should happen to be supplied in their place.

Note that in each instance only the one lock-washer supplied on the battery terminal is required,

At right is section of a typical card-type connector. Card goes on battery terminals first, then lockwasher, then nut.

The lockwasher goes on first, followed by lug, then nut, when connection is typical cable lug to terminal post.

and all that's important is that it be installed where it can best prevent the battery terminal nut from vibrating loose. Thus where the cable has lugs the lockwasher should always go under the lug. Where the cable terminates in a card the lockwasher should always go on top of the card.

To this SOP we can find no exception applicable to the connecting of cables to batteries in underwater mines. That being the case we will most certainly change the various assembly OPs to agree just as soon as it is practical to do so. Meanwhile we invite Hallstrom's production-quality inspector and all others interested in quality (e.g., maximum reliability) to adopt the installations as we show them here.
